

Soil – hydrologic conditions after the windstorm 2004 in the Tatra Mts

Peter Fleischer

Research station and Museum of TANAP
Tatranska Lomnica

The Tatra Mts – huge mountain barrier

specific climate

- downslope winds
- precipitation regime

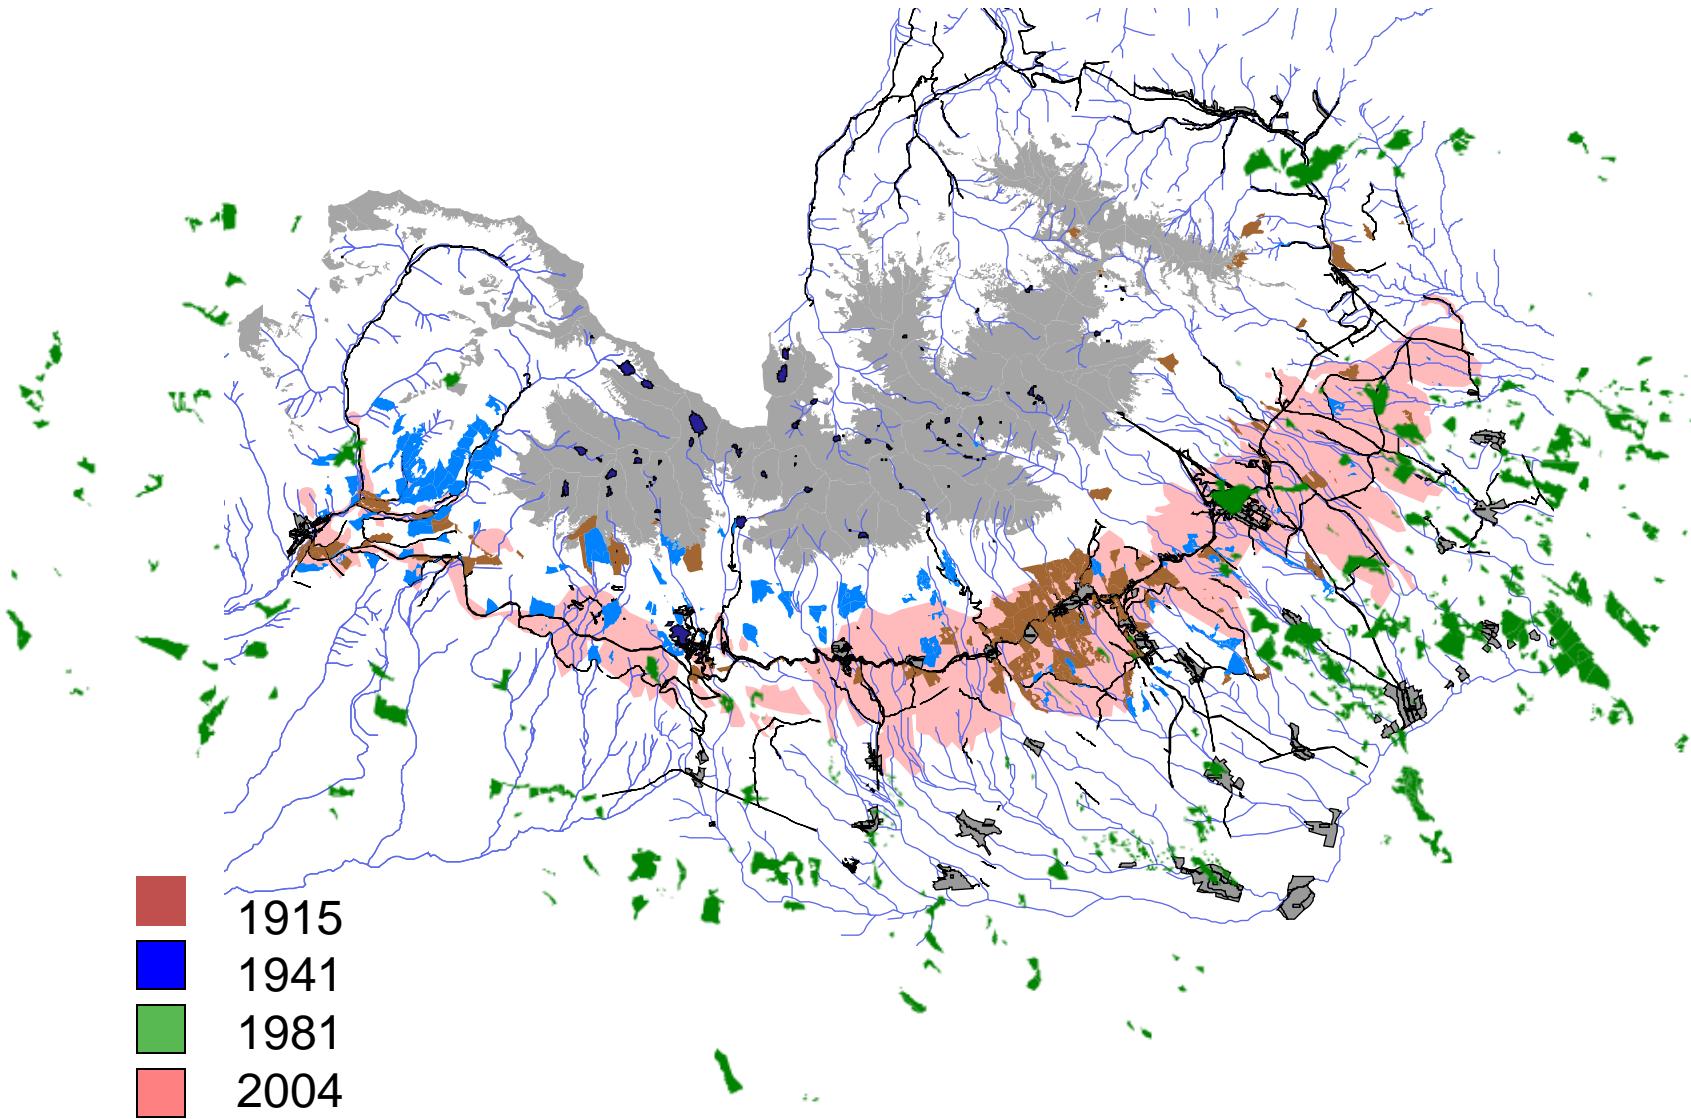

Windstorm November 19, 2004

windfall 12 000 ha
volume 2,3 mil m³
wind gusts 230 km/h

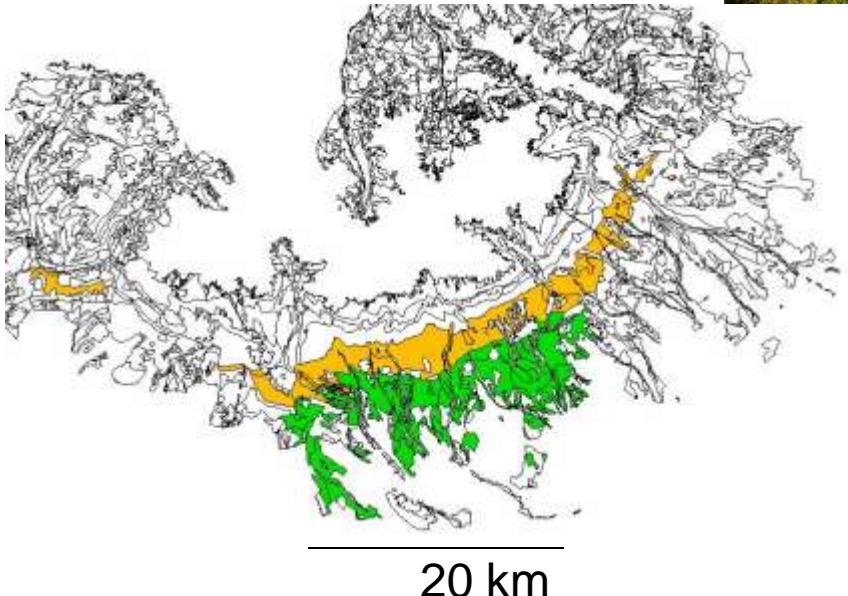

History of large-scale windfalls since 1915

The Tatra Mts as an anemo-orographic system

- regional scale: spruce –larch forest
- successional stage
- blocked forest development cycle
- no climax
- microsite scale:
- pit and mound formation

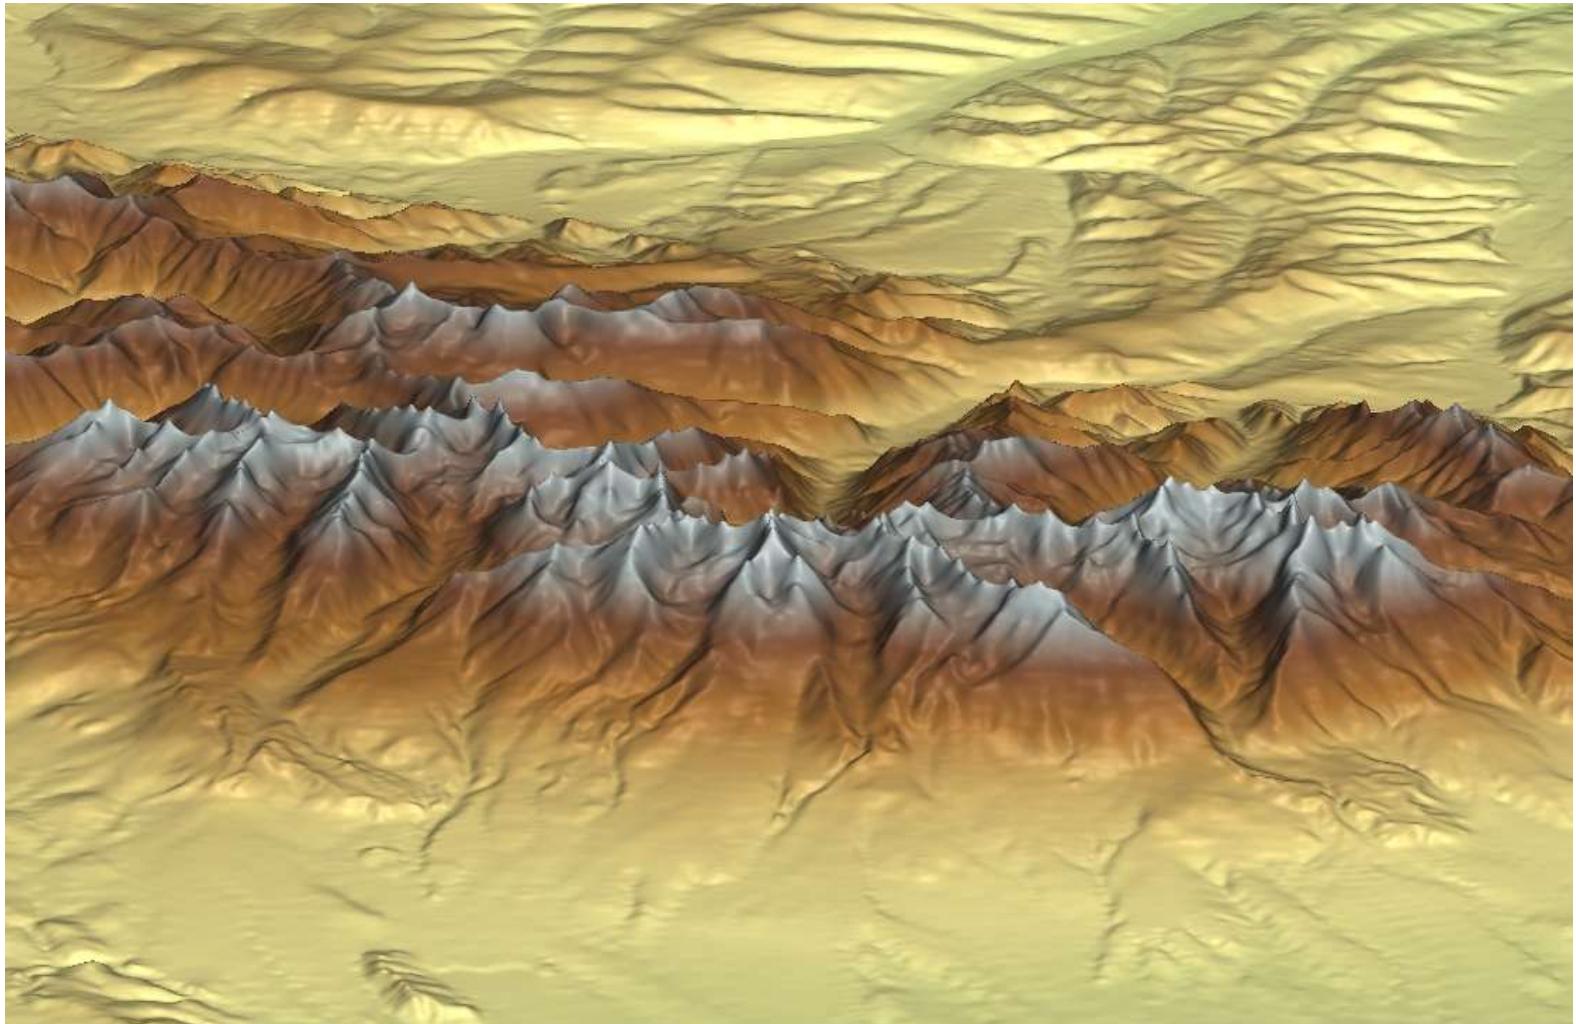

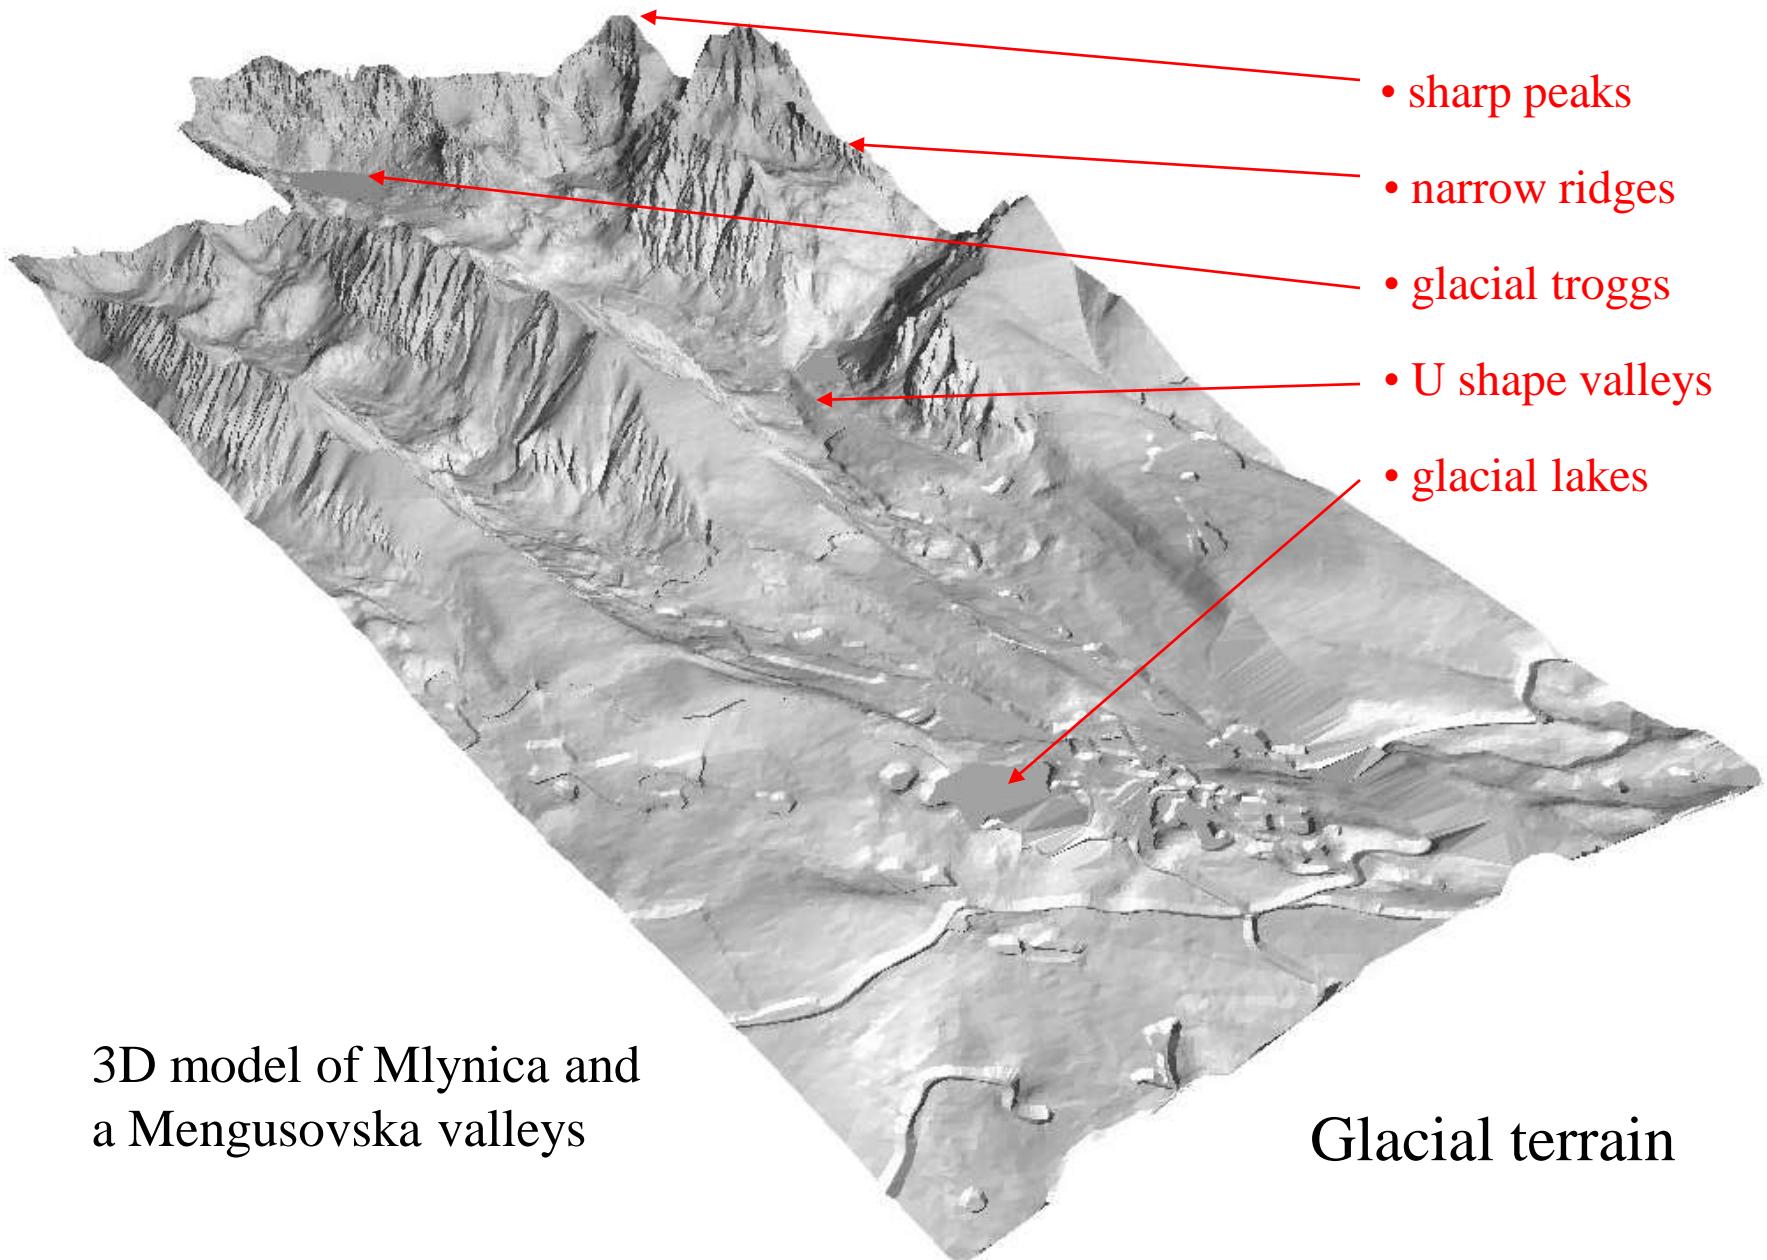

The Tatra Mts

precipitation pattern

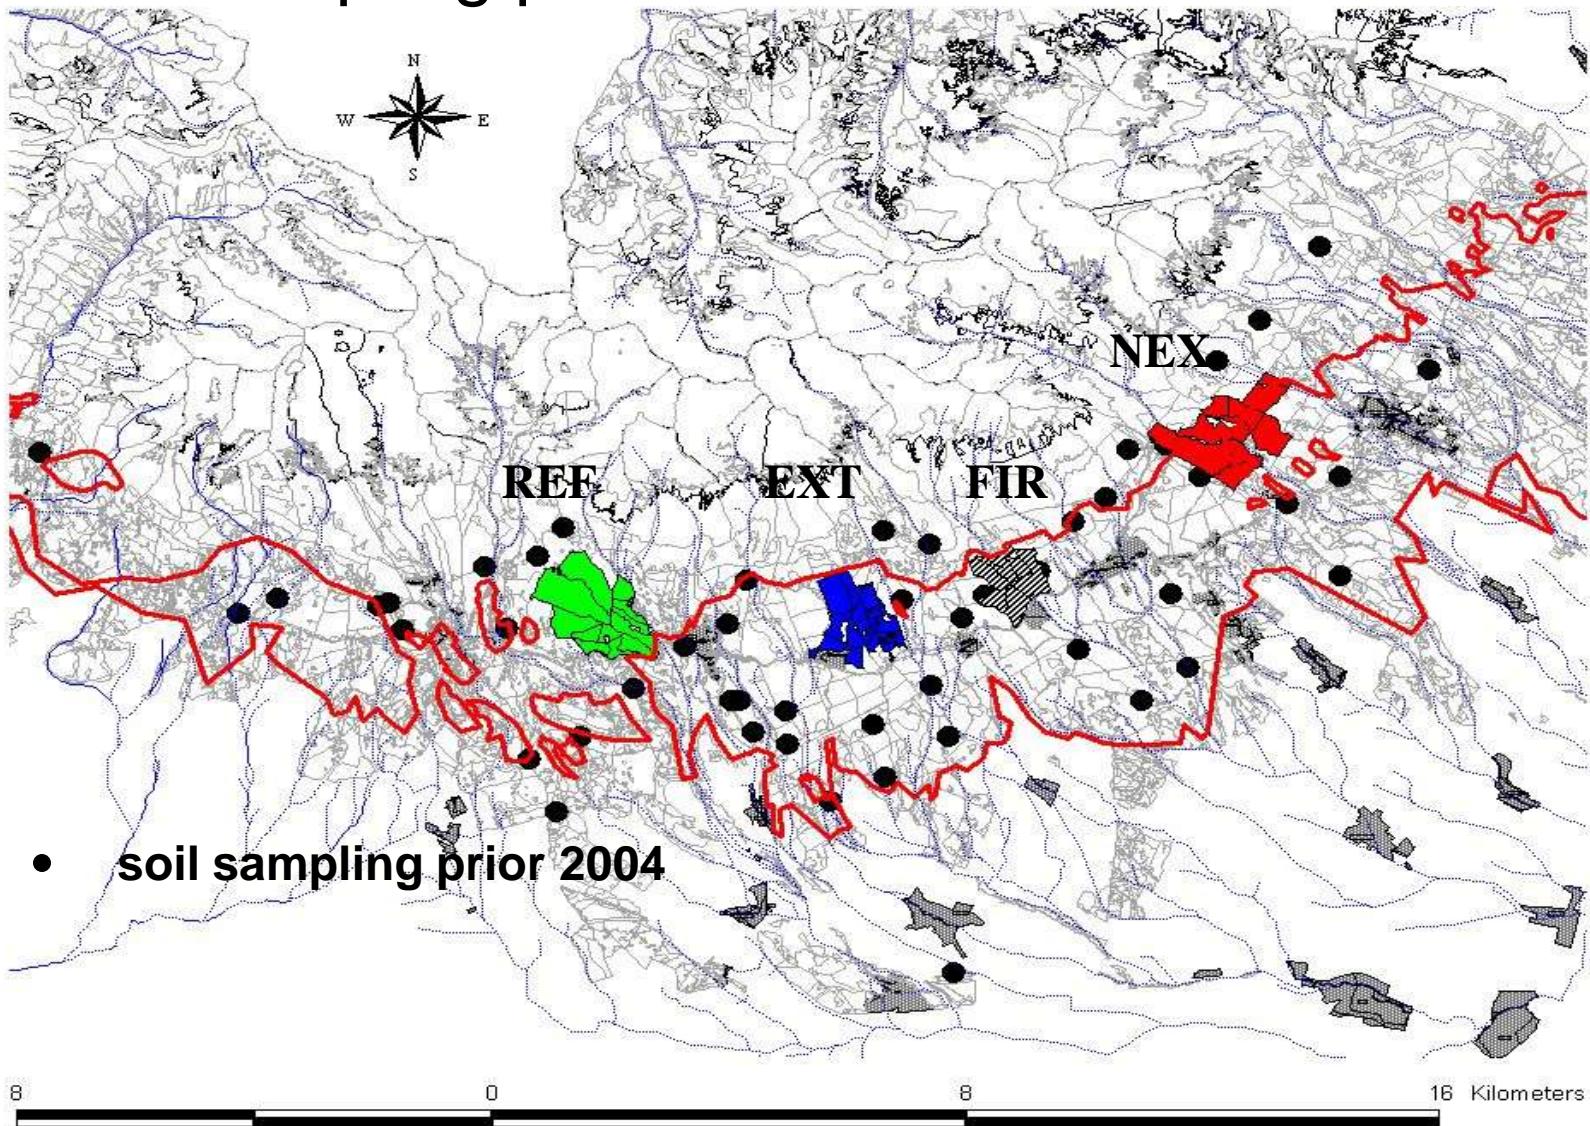

precipitation shade

vertical gradient

Soil sampling prior and after 2004

Soil properties (before 2004) on current windfall

Type: Podzolic cambisol

Humic podzol

Organic humus layer 6-10 cm (p 0.05)

Stones: A 33%

B 44%

Particle size: loam (A, B)

Humus cont. : A 16% (2-28)

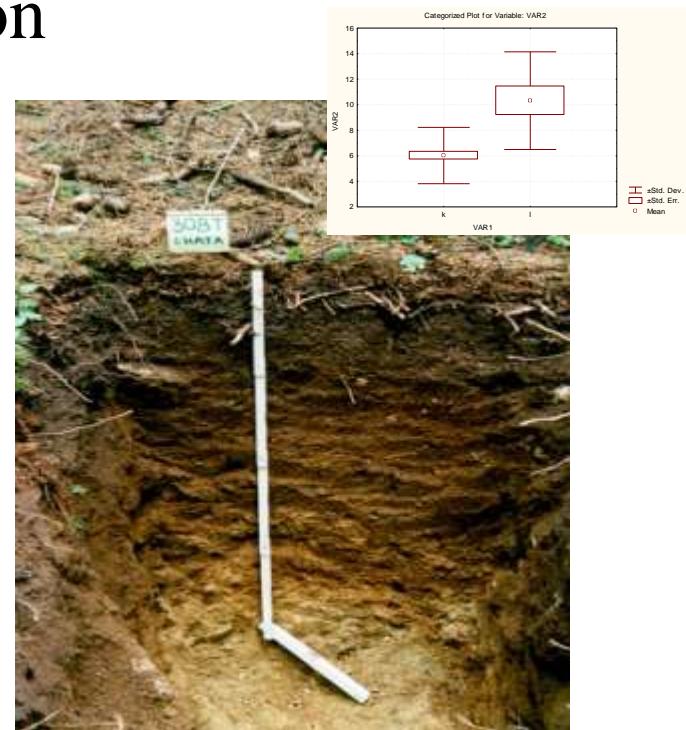

B 7%

C:N ratio: A 18 (10-22)

B 16

pH (H₂O) A 3.1 – 4.4 (med 3.7)

B 3.2 – 4.6 (med 4.0)

Confirmed by post-windstorm analysis

Novak et al, Simonovicova et al., Gomoryova et al., MPI Jena

Interception in closed Norway spruce forest

>50%

Soil –hydric conditions as a part of Windfall research

multidisciplinary ecological research and monitoring on consequences caused by windfall on forest ecosystems and their surrounding under different management

FE components

atmosphere

soil

water

vegetation

fauna

microorganisms

H:

humus mineralisation and reduction

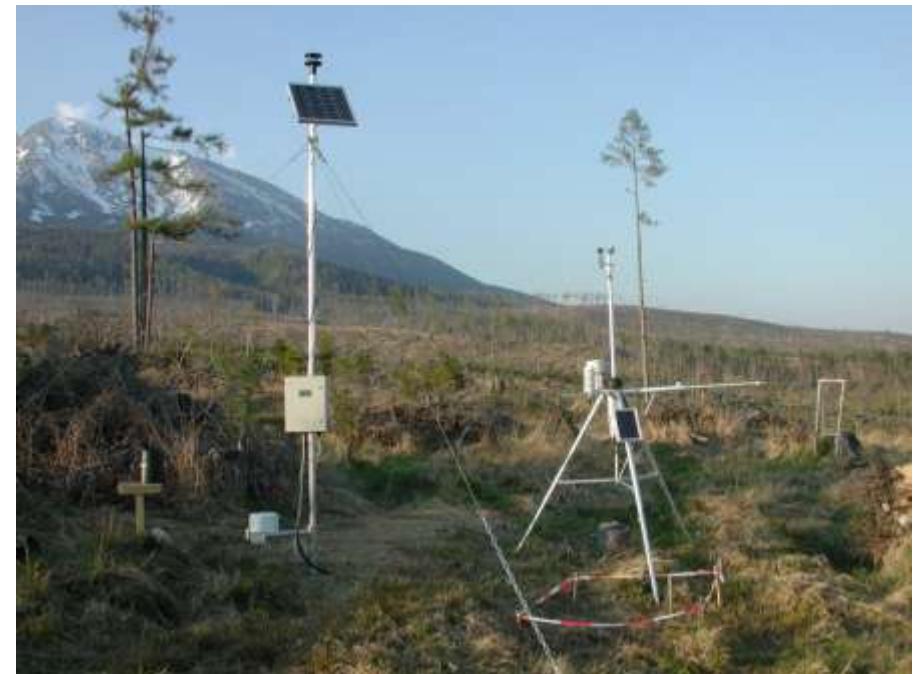

nutrient leaching, water quality, N

erosion

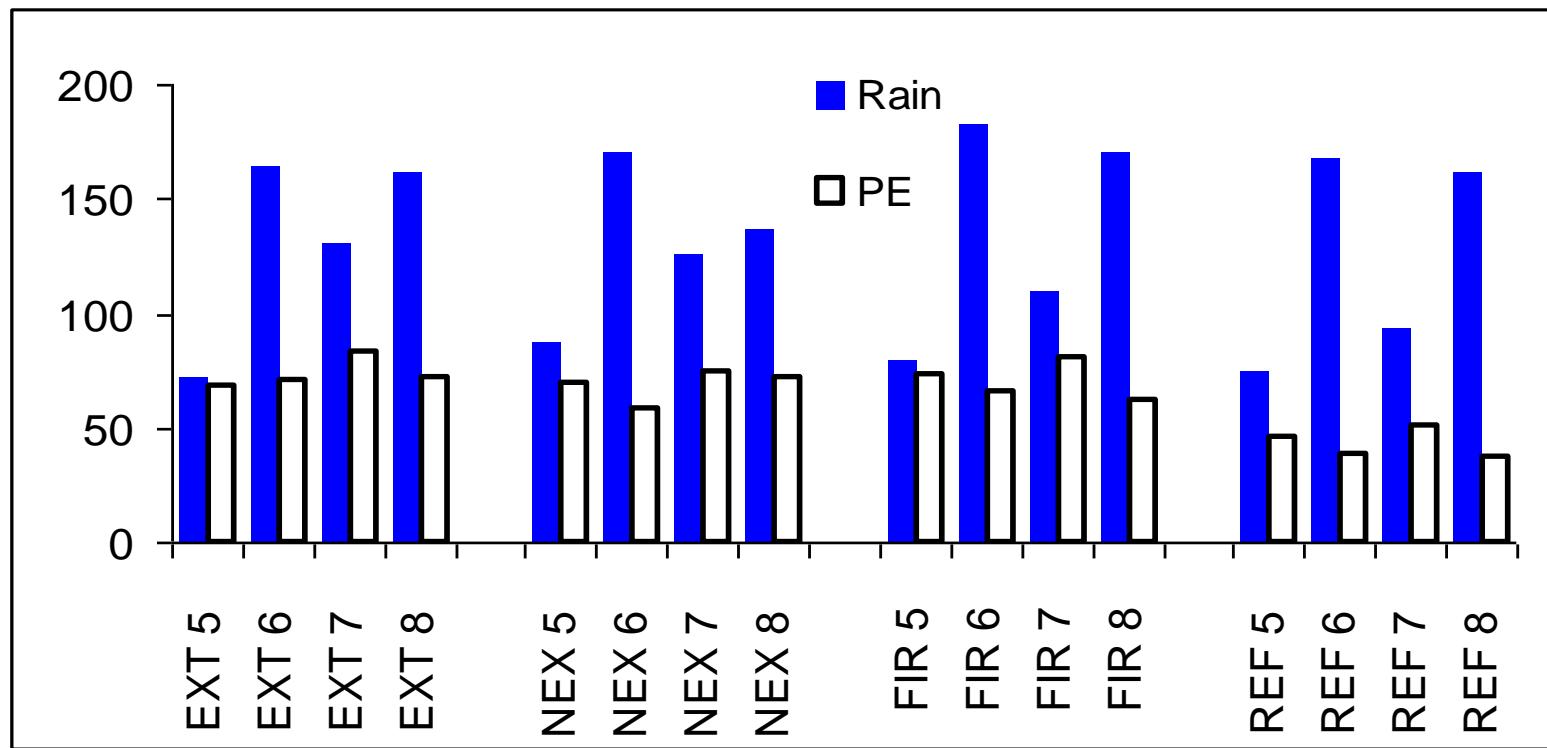

extremal hydric regime, moist-wet, dry-very dry

top soil overheating

deeper and longer soil frost

Potential evapotranspiration

based on 2009 (V-VIII) monthly avg AT and RH (Ivanov's method)

Soil temperature and moisture

each site equiped with:

- thermometer (PT100, PT108)

in 8 and 16 cm depth

- theta Delta ML2x, impedance meth.

manual verification

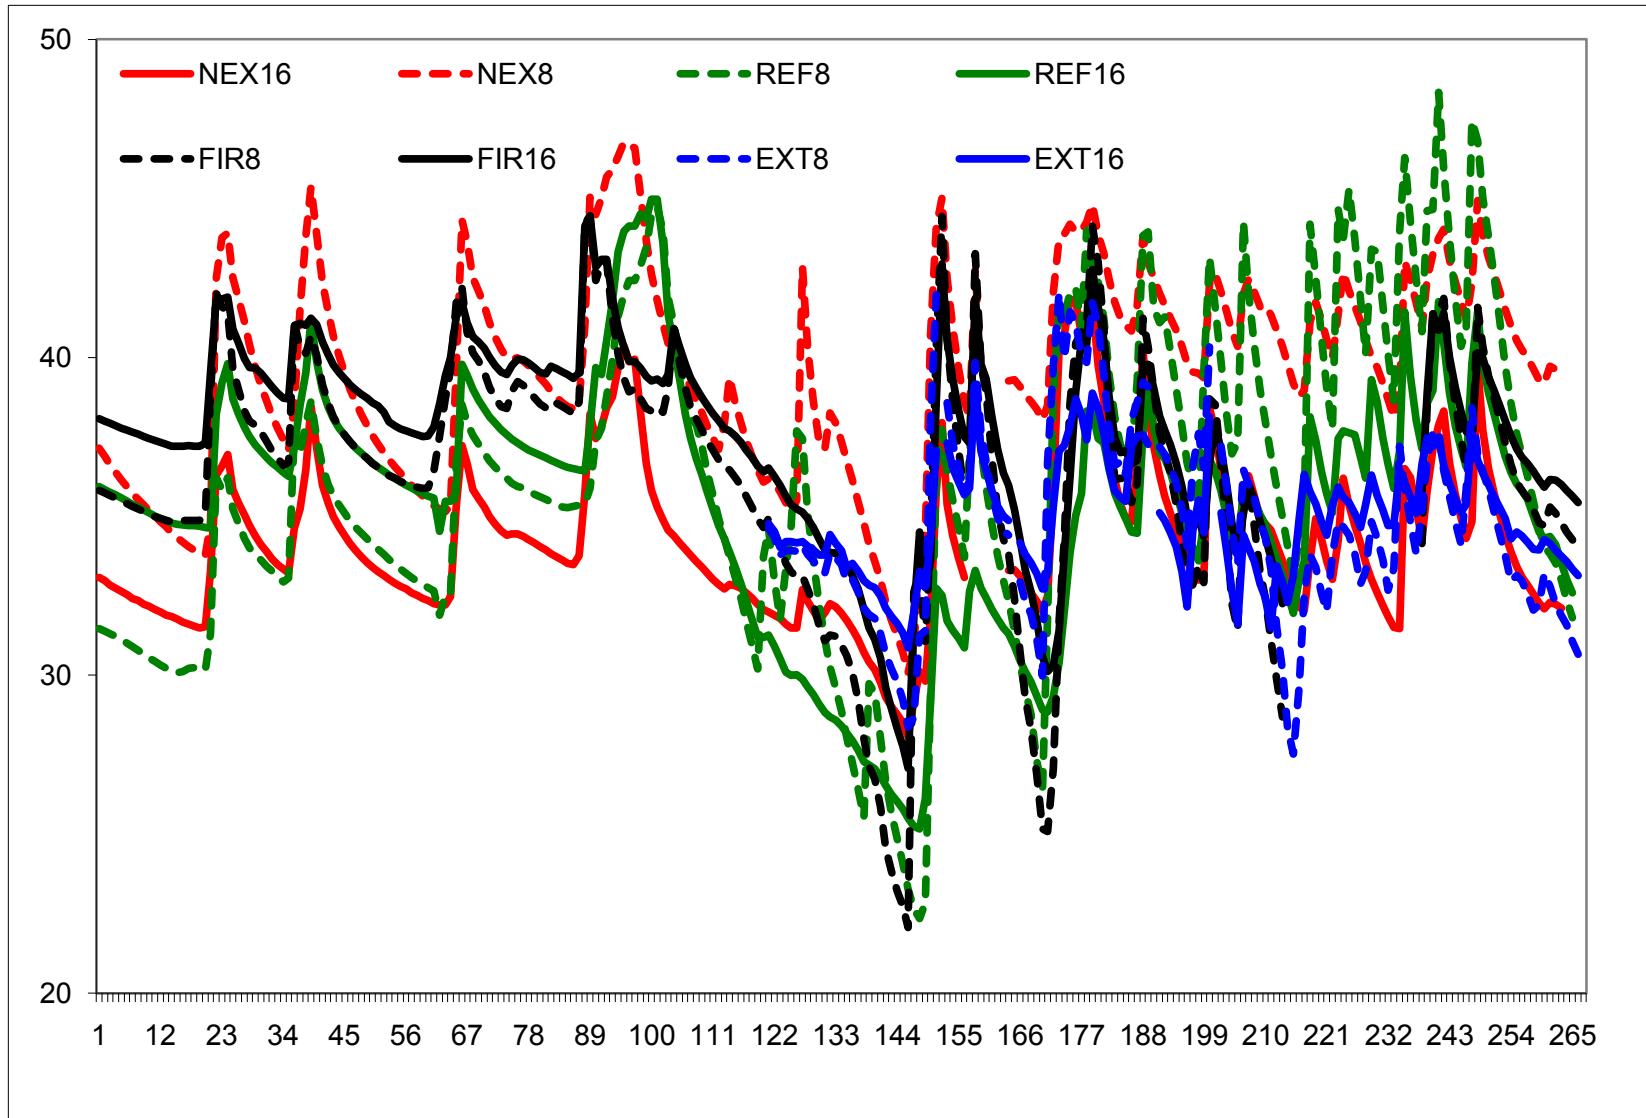

- precise laboratory thermometer

- portable ML2x

- gravimetry

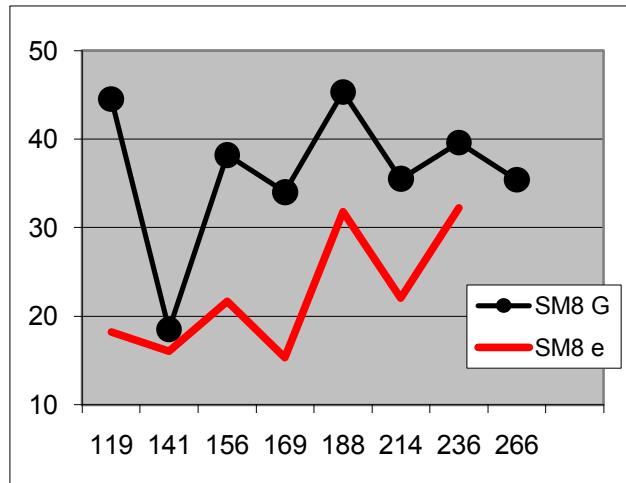

Soil moisture (% V) in 2009, all localities

FIR 2009 SM % (V) vs G

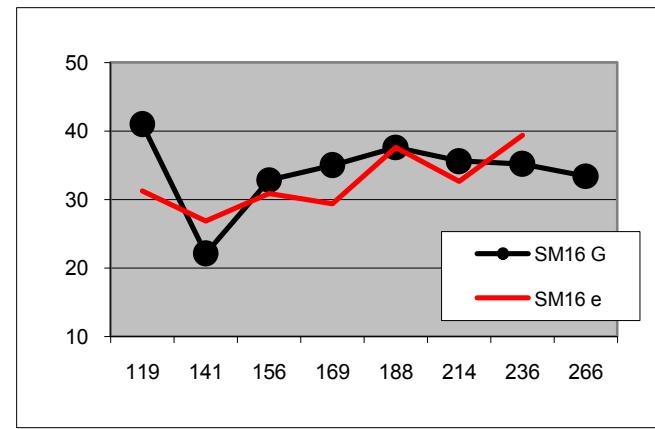

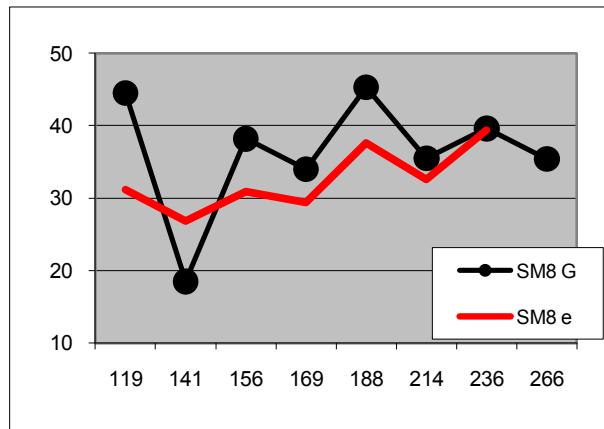

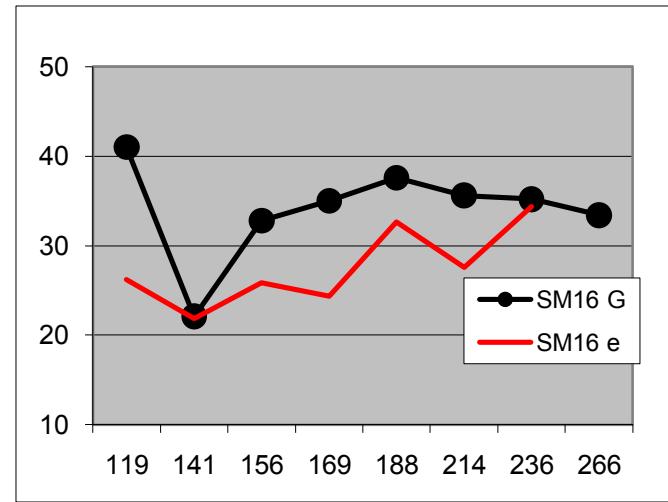

FIR 2009 SM8

prior humus content corr

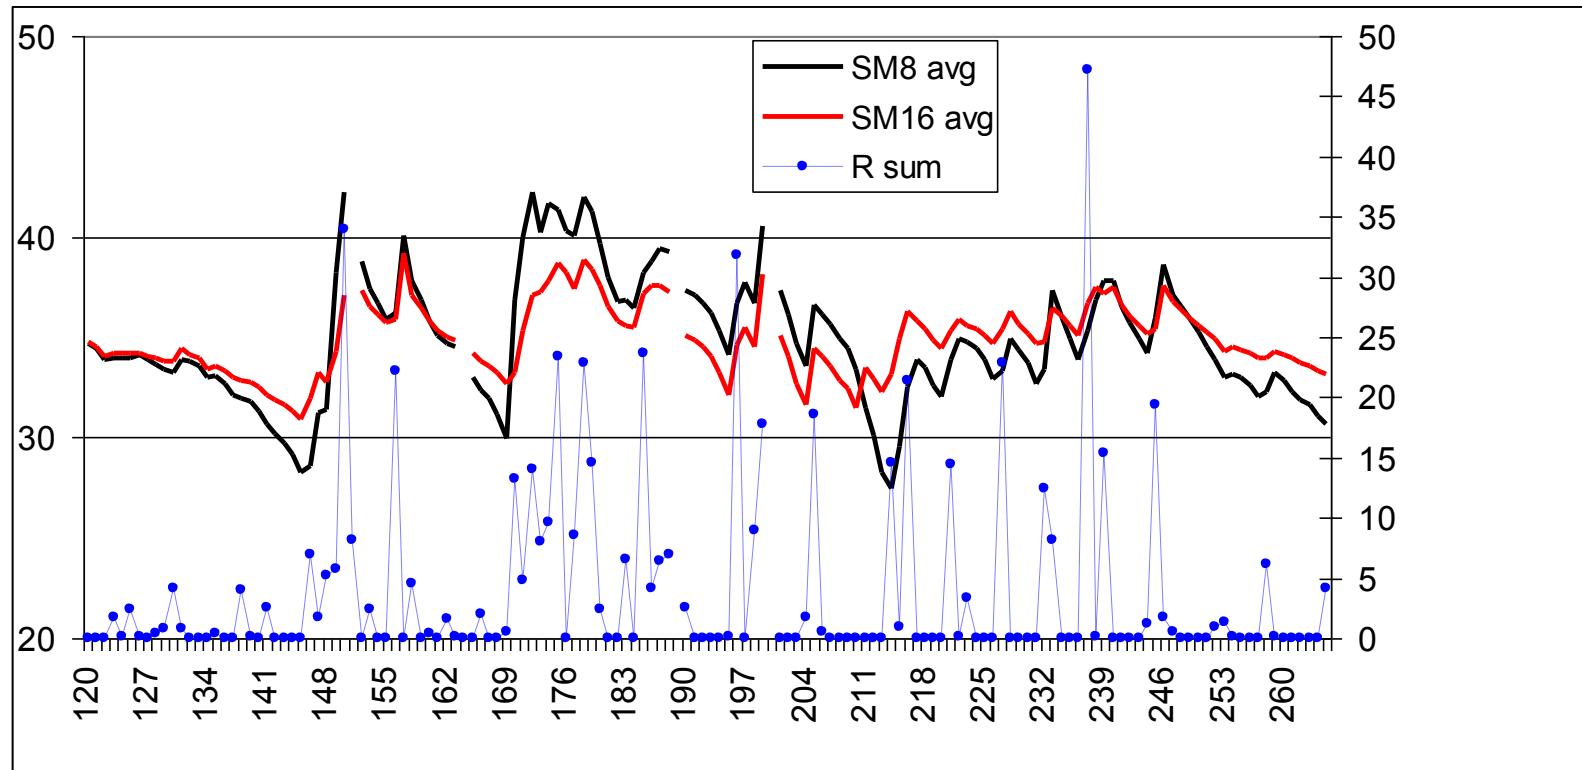

FIR 2009 SM16

after humus content corr

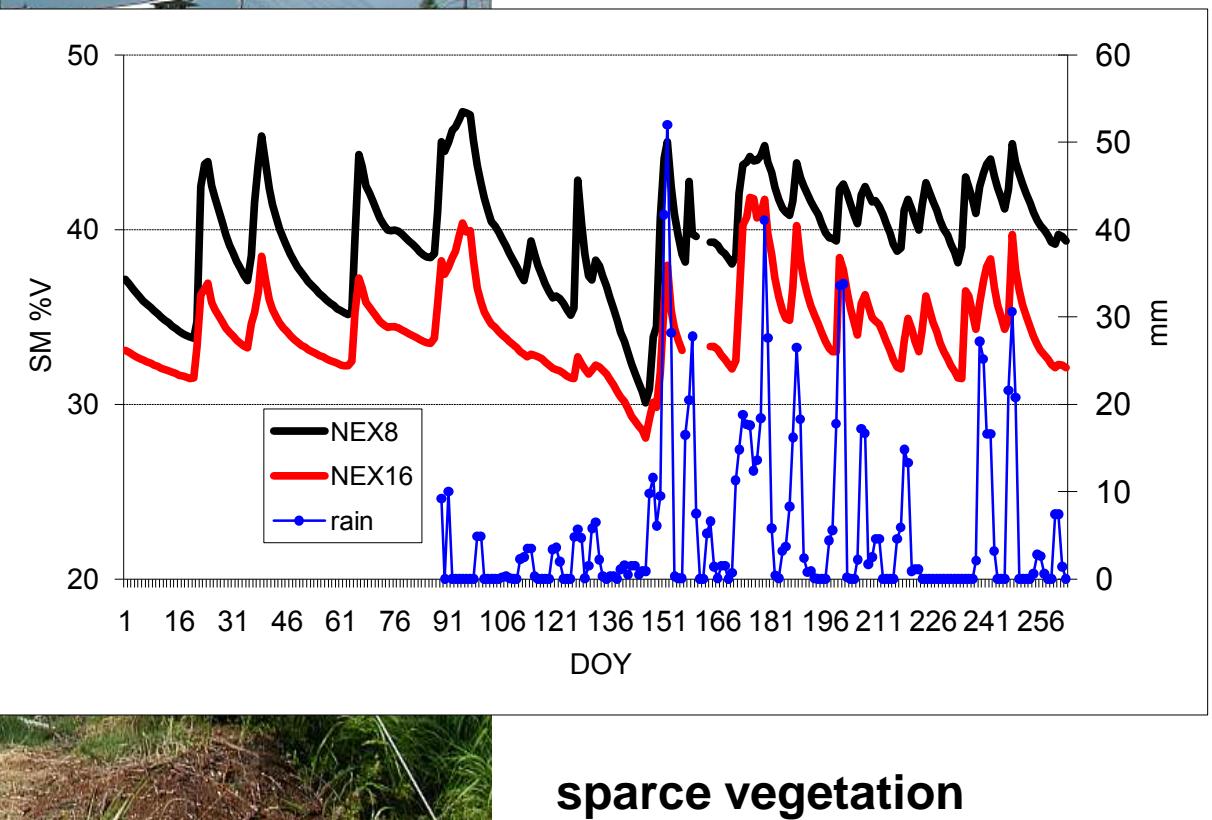

EXT 2009 SM8, SM16 and Rain

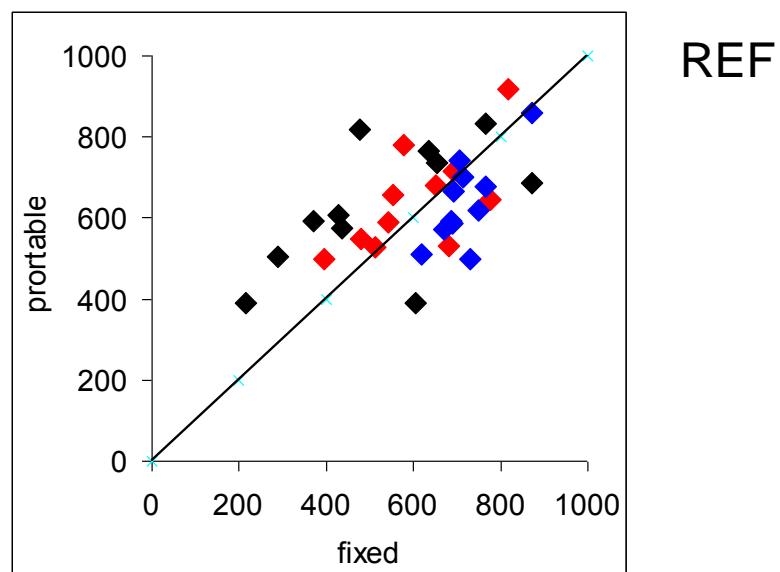

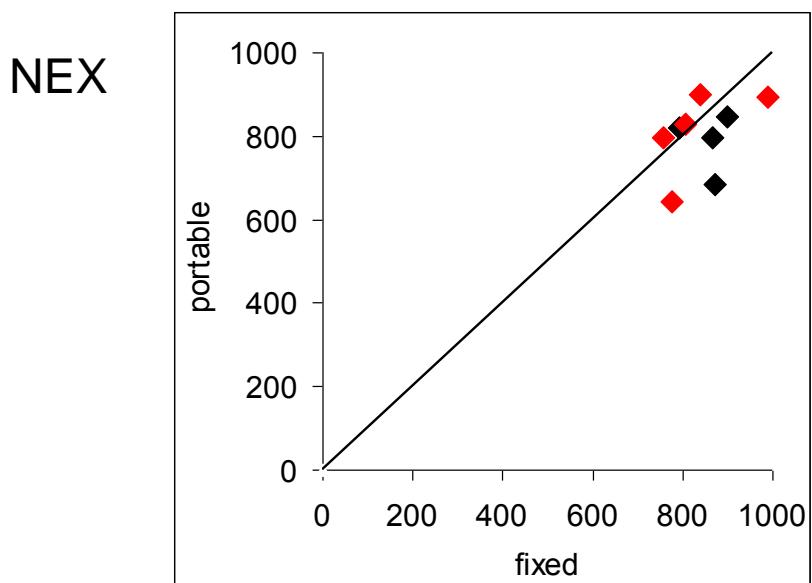

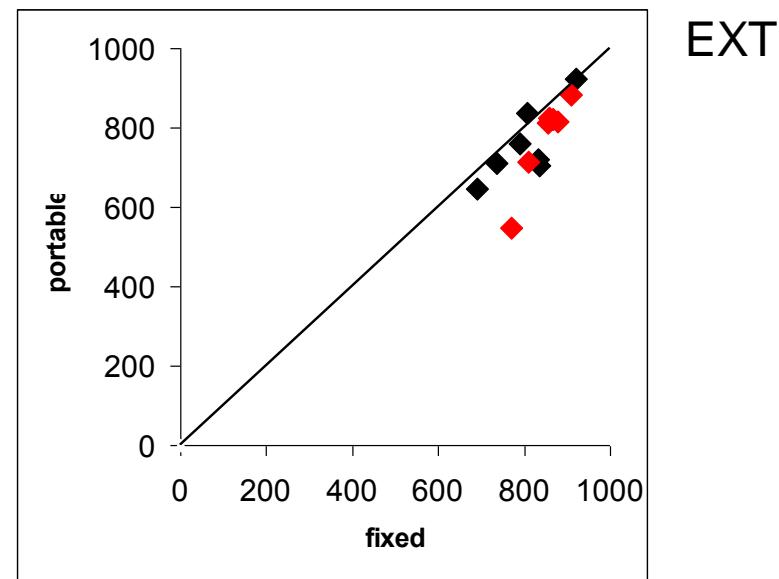

dense grass vegetation
A loam
B loam

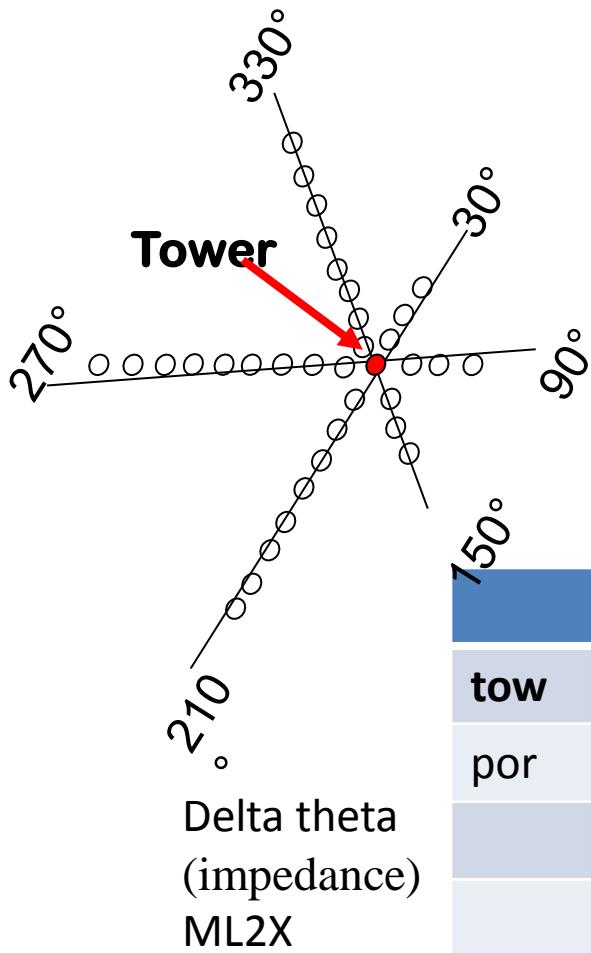

NEX 2009 SM % (V) and R

sparce vegetation
A – loam
B1- sandy loam
B2- sandy

Soil moisture verification
